A unique atmospheric observatory situated in the Indian Ocean, about 700 km east of Madagascar and 170 km southwest of Mauritius providing the background state. In addition, we see the influence of biomass burning in Madagascar, South Africa and South America

One of the very few atmospheric observation stations providing both in-situ and remote sensing greenhouse gas (GHG) data for atmospheric components in the southern hemisphere

Two dedicated sites – St. Denis (83 m.a.s.l) and Maïdo (2154 m.a.s.l)

Instrumentation at St. Denis and Maïdo

- Stratospheric CH₄: vertical transport
- Tropospheric CH₄: OH variation

Conclusions

- ❑ Long term measurements of surface and total column CO₂, CH₄ and CO concentrations at Reunion Island (Indian Ocean).
 - ❑ TCCON CO₂ total columns have a good sensitivity to the troposphere.
 - ❑ CO spikes (both surface and total column) in September-November corresponding to the biomass burning in Africa and South American.
 - ❑ TCCON and NDACC CH₄ total columns have a good sensitivity to the troposphere, and also to the stratosphere. CH₄ different seasonal cycles are observed in the troposphere and stratosphere.

Thank you for your attention
